

AEM Task-8

1.What is MSM, blueprint, live copy and rollout?

MSM:

MSM is a feature in AEM that helps you manage multiple websites from a single source. These websites may be in different languages, regions, or brands, but have a similar structure and content.

Blueprint:

A Blueprint is the master site or source site that you use to create other versions of your site (called live copies). It contains the base structure and content that can be inherited.

Live Copy:

A Live Copy is a site (or part of a site) that was created from a blueprint. It inherits content and structure from the blueprint but can be customized if needed.

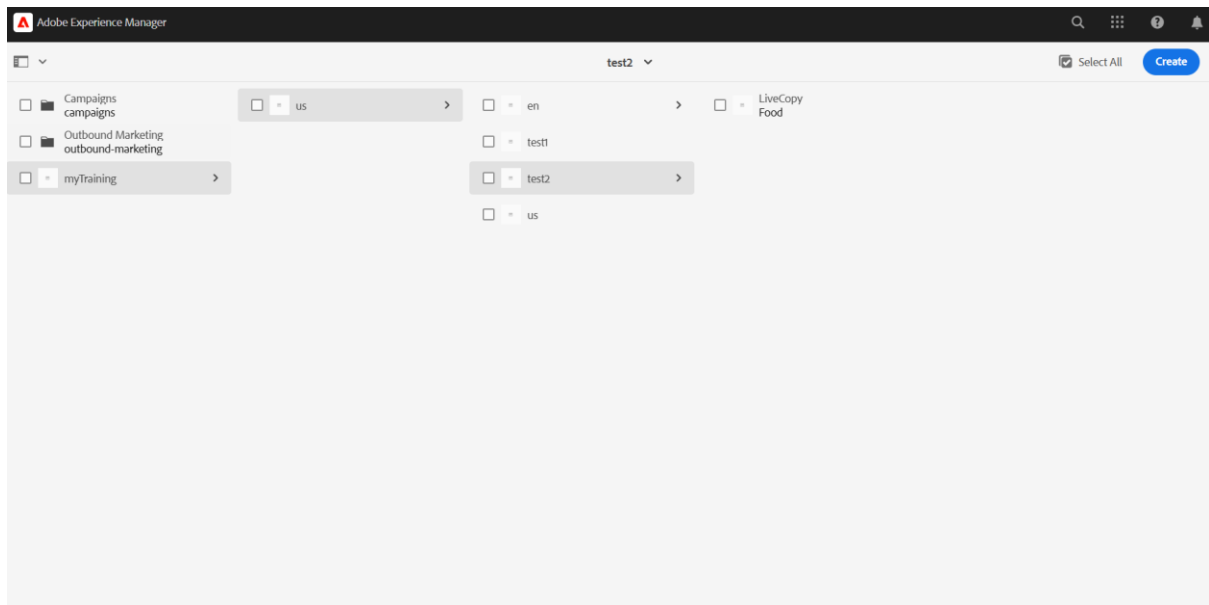

Rollout:

A Rollout is the action of pushing updates from the blueprint to one or more live copies. It keeps the live copies in sync with the master site.

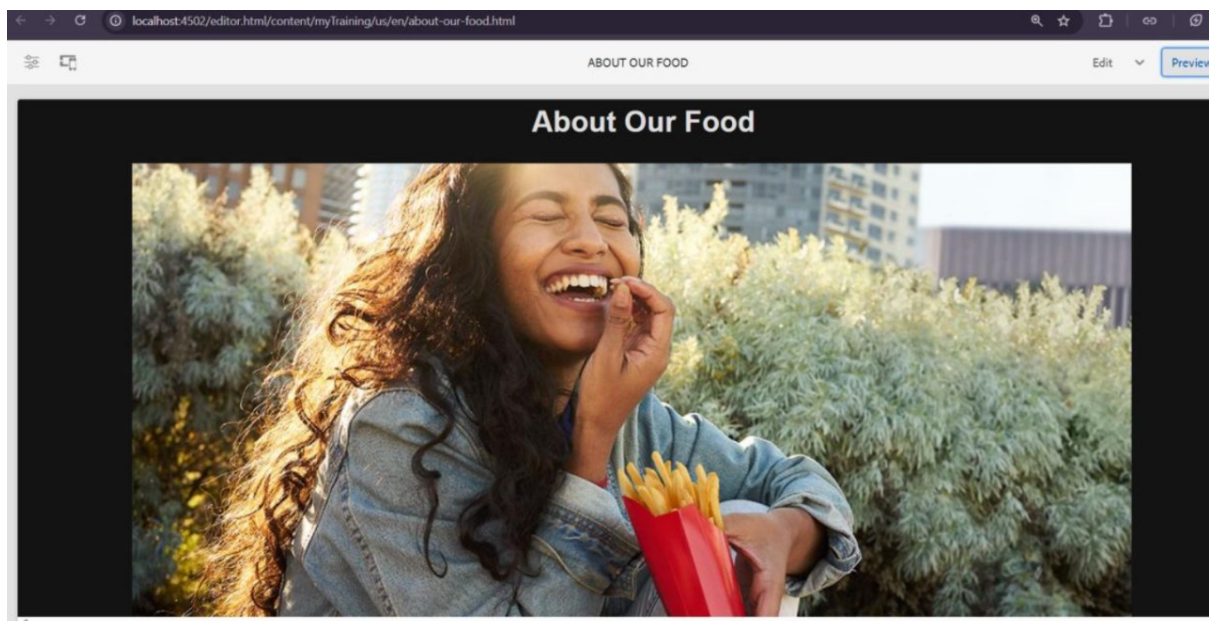

2.What is a Language Copy?

A Language Copy in AEM is a translated version of a website or page. It is used to create localized content for different languages or regions, without linking it to a master/blueprint site like in MSM (Multi Site Manager).

3. Create a site using MSM and us en should be source

4. Create this page <https://www.mcdonalds.com/us/en-us/about-our-food.html>

What's in Your Food

Find out what makes our ingredients special.
